For red wines roundness and smoothness

**Description**

Opti-Red® is a unique natural yeast preparation that has undergone a specific preparation process to obtain a high level of polyphenol-reactive cell-wall polysaccharides. Using Opti-Red® in the must provides early high molecular weight polysaccharides availability for complexing with polyphenols as soon as the polyphenols are released and diffused.

This early formation of polysaccharides-polyphenols complexes results in red wines with more intense colour, rounder mouthfeel and better tannin integration. Opti-Red® can be used alone or in conjunction with oenological maceration enzymes.

**Application and results**

- **Increase of polyphenolic stability**

  Impact of yeast polysaccharides is limited to their availability due to yeast autolysis at the end of primary fermentation. With the use of selected natural yeasts known to excrete high amounts of polysaccharides during the growth phase, tannin and polysaccharide complexes formation begins earlier. These polysaccharides can be made available at the beginning of maceration by adding Opti-Red® to the must. Figure n°1 illustrates how adding Opti-Red® at the beginning of red winemaking impacts on the content and stability of tannins and the astringency of wine.

• **Increase of colour stability**
  Polyphenol colloid precipitation can be avoided in the presence of available polysaccharides which have a “protection” function that prevents precipitation of high molecular weight polyphenol colloids. Therefore, polyphenols show better stability during aging when they are protected by Opti-Red® polysaccharides thanks to the formation of anthocyanin-tannin-polysaccharide complexes. After adding Opti-Red® at the early stages of red winemaking, wines show less color loss before and during aging.

• **Increase of mouthfeel (roundness and smoothness)**
  Polysaccharides have a positive impact on mouthfeel, bringing more roundness to the wine. Figure n°2 shows the impact of Opti-Red® addition on wine sensorial quality: more mouthfeel, less astringency & better overall quality.

Adding Opti-Red® at the beginning of fermentation is particularly interesting for low phenolic potential grapes, low maturity harvests and/or high yield, to enhance stability of the early extracted polyphenols (prefermentative maceration, thermovinification,...) and for primeur wines.

**Dosage and instructions for use**
- Recommended dosage is 20 g to 40 g/hL (1.7 to 3.4 lb per 1 U.S gallon).
- Suspend Opti-Red® in ten times its weight of water or juice and mix.
- Add to the must at the beginning of fermentation.
- Opti-Red® also provides a minor supply of yeast nutrients, but does not replace the regular nutrition program integrating juice parameters and the nutritional needs of yeast strains.

**Packaging and storage**
- Opti-Red® is supplied in 1 kg, 2.5 kg or 10 kg sealed alu foil bags.
- Store in a dry environment below 25°C.
